

CSE 112 – Lab File Line Numbers – File Handling and I/O and IPO Document

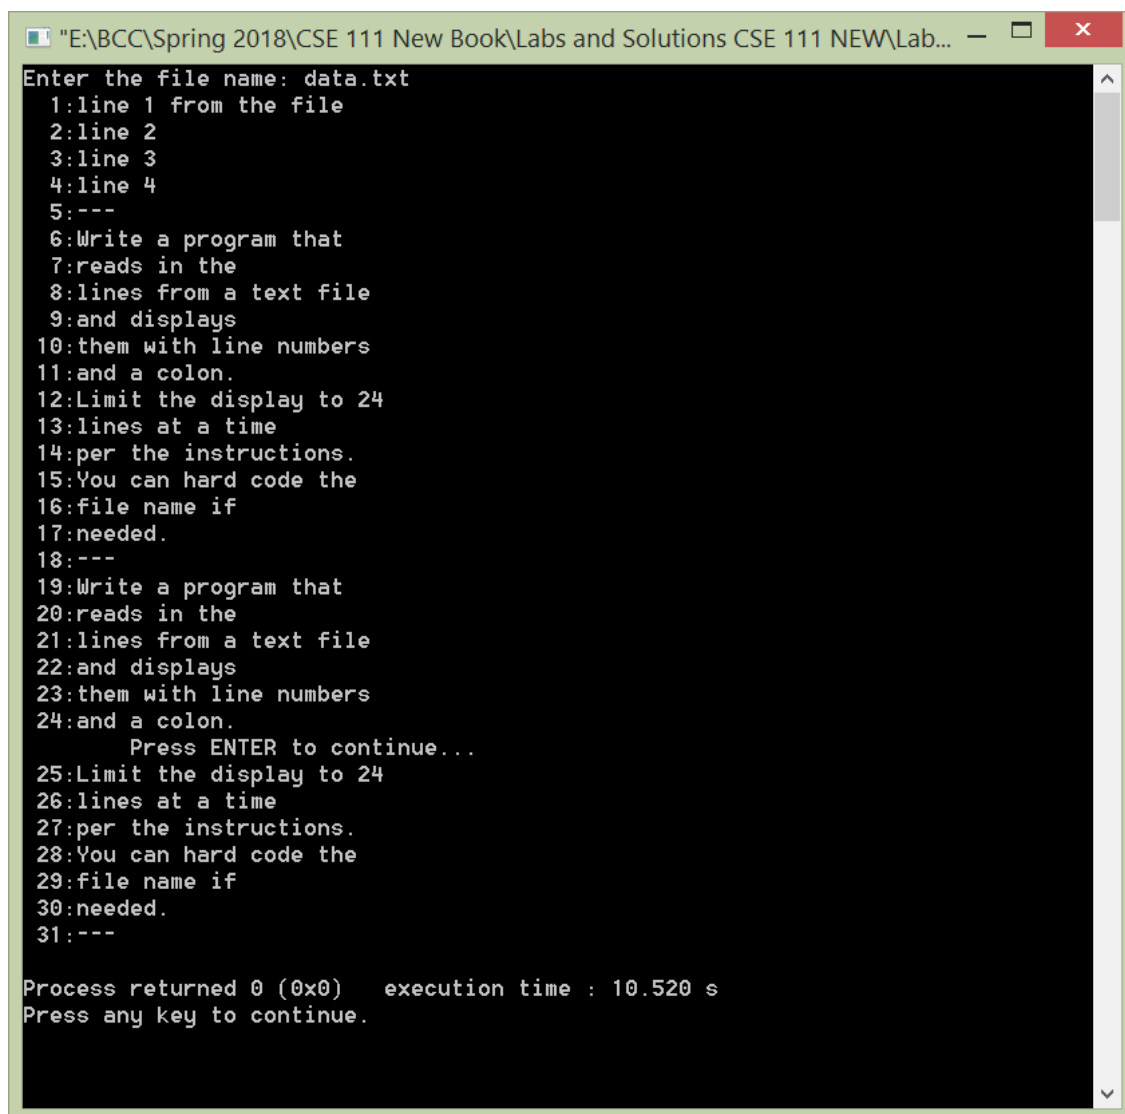

Ref: Chapter 12 Programming Challenge #5 (page 714)

Write a program that requests a file name, and reads in the lines from the text file and displays them with line numbers and a colon (file contents shown below). Limit the display to 24 lines at a time per the text instructions (press a key). The program may require two (2) `cin.get()` functions to pause correctly.

The output of the line numbers will be right aligned as shown below. The program may be handled solely in main. The text for the file is below. Include an **IPO submission** with the lab (**10% of grade**).

Grading will be based on meeting all of the lab requirements, **adherence to programming standards**, operation and accurate output, and **programming style including spacing and indentation**.

Sample Screen Capture.
